The invention comprises a method for delaying the development of, or treating a tumour that is associated with human milk fat globules (HMFG) or carcinoembryonic antigen (CEA). The method of the invention involves administering an anti-idiotypic antibody for HMFG (e.g. 11D10), and an anti-idiotypic antibody for EA (e.g. 3H1). The method is useful for present cDNA sequence encodes the interior of the involves the interior of the involves associated tumours. The mouse 11D10 anti-idiotype antibody.

The conjugate is capable of delivering the antigen to ARC and eliciting an immune response to the antigen. The new conjugates are useful as vaccines and are able to elicit an enhanced immune response without the use of an adjuvant. In a specific example, a conjugate was constructed using the murine anti-human class II monoclonal antibody secreted by hybridoma attandemly linked T and B cell epitope derived from HIV MN strain. The present sequence encodes the light chain variable region which was PCR amphilited from 44H104 and used in the preparation of a

The invention relates to a recombinant conjugate antibody, comprising
Novel recombinant conjugate antibody, useful as a vaccine against pathogens having a specific antigen, comprises a monoclonal antibody specific for an antigen presenting cell surface structure -
                                                                                                                                                                                                                        a monoclonal antibody specific for a surface structure of antigen presenting cells genetically modified to contain an antigen moiety for the purpose of delivery of the antigen moiety to antigen-presenting cells of the immune system. The conjugate antibody is 'formulated as a vaccine to protect a host against a disease caused by a pathogen expressing the antigen. The antibody is useful as a detecting agent. The present sequence is murine 44H104 mab variable

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents the consensus nucleotide sequence comprising the variable region of murine Act-1 antibody determined from several independent mouse light chain variable region clones. Act-1 is active against human alpha-beta7 integrin. Muscosal adressin cell adhesion molecule-1 (MadCAM-1) is a ligand of this particular integrin. The Act-1 antibody inteferes with alpha-beta7 integrin blinding to MadCAM-1, which is present of high endothelial venules in mucosal lymph nodes. Variable regions were amplified from pla encoding Act-1 using degenerate PCR primers Avy20083-84. The degeneracy of the PCR primers produced several different sequences, of which the present sequence is a consensus sequence. The present sequence was used to

antigen binding regions. The humanised immunoglobulin can be used to inhibit the interaction of cells bearing alpha4-beta7 with cells bearing a ligand for alpha4-beta7. It can be used for inhibiting leukocyte infiltration of tissues, e.g. for treating inflammatory diseases such as inflammatory bowel disease. The immunoglobulin can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAQ90425-Q90434 are DNA molecules encoding anti-idiotype antibodies Idio3, Idio17, Idio20, Idio27 and Idio33 against a human articancer monoconal antibody. These artibodies and BNA encoding them are useful in pharmacological, medical and biochemical fields of research.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel anti-idiotype antibody against an human anticancer monoclonal antibody - and DNA sequences encoding the antibody, useful in pharmacology, medicine and biochemical fields.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibody; cancer; CDR; heavy chain; light chain; immunoglobulin; complementarity determining region, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anti-idiotype_antibody_Idio17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA encoding anti-idiotype antibody Idio17 clone 17KB1.

The invention relates to methods for producing catalytic antibodies displayed on a phage. The method comprises: (a) generating agene library of antibody-derived domains; (b) inserting coding for the domains into a phage expression vector; and (c) isolating the catalytic antibodies. The phage expression vector incorporates a histidine peptide in tandem with a mitigen; optionally immunising an animal with the antigen; generating an antigen; optionally immunising an animal with the antigen; generating at library of VH and VL domains from the immunised animal; cloning the VH and VL domains into a phage expression vector to generate phage display antibodies; selecting phage display antibodies which bind specifically cot the antigen: screening the selected phage display antibodies for catalytic activity to substrate; and isolating the catalytic antibodies, where the phage expression vector incorporates a histidine peptide in tandem with a myc peptide. The processes are used to produce catalytic antibodies, which can be used for in vivo activation of a prodrug. The present sequence represents a genetic sequence of light chain pCR pattern C from mouse derived RT3 phage antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Catalytic; antibody; phage display; immunising; phage expression vector;

                                                                                                                                                                                                                                                                                                                                                           The invention relates to methods for producing catalytic antibodies displayed on a phage. The method comprises: (a) generating a gene library of antibody-dearlyed domains; (b) inserting coding for the domains into a phage expression vector; and (c) isolating the catalytic antibodies. The phage expression vector incorporates a histidine peptide in tandem with a cutient optionally immunising an animal with the antigen; generating a library of VH and VL domains from the immunised animal; cloning the VH and VL domains from the immunised animal; cloning the VH and VL domains into a phage expression vector to generate phage display antibodies; selecting phage display antibodies which bind specifically to the antigen; screening the selected phage display antibodies for catalytic activity to substrate; and isolating the catalytic antibodies; where the phage expression vector incorporates a histidine peptide in tandem with a myc peptide. The processes are used to produce catalytic antibodies, which can be used for in vivo activation of a product of antibodies, which can be used for in vivo activation of a producy. The processes are used to produce catalytic antibodies, which can be used for in vivo activation of a producy. The processes are used to produce catalytic antibodies, which can be used for in vivo activation of a producy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antigen binding site; immunoglobulin; cancer antigen; immunological; antibody; tumour; human; mucin; cancer; cytostatic; hybridoma; specific binding assay; affinity purification; drug targeting; toxin targeting; imaging; genetic; therapeutic; ss.
                                                                                                                                                                                                                Production of catalytic antibodies displayed on bacteriophages - comprises generating a gene library of antibody-derived domains inserting coding into a phage expression vector and isolating the catalytic antibodies

binds to a human breast cancer antigen that is also bound by MAD 454C11 and 520C9 (produced hybridoma ATCC HB8484 and HB8696, respectively). Also described is a hybridoma that produces (I). (I) is useful in specific binding assays, affinity purification, drug or toxin targeting, imaging, and genetic or immunological therapeutics for various cancers. The present sequence encodes a VL domain derived from a 520C9 hybridoma, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Anti-Interleukin-18 antibody; IL-18; light chain variable region; VL; hybridoma #125-2H; mouse; monoclonal antibody #125-2HmAb; interleukin-18; antiinflammatory; immunosuppressive; leucocytopoietic; antialgic; antipyretic; antiallergic; hepatotropic; treatment; autoimmune disease; immunopathy; inflammatory disorder; immunoreaction; ss.
                                                                                                                                                                                                                                                                                                            Monoclonal antibody capable of binding to human breast cancer antigen useful for affinity purification, drug or toxin targeting, imaging, and treating cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a monoclonal antibody (MAb) (I) that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse anti-IL-18 antibody VL encoding cDNA from hybridoma #125-2H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       321

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present cDNA sequence derived from hybridoma #125-2H, encodes mouse anti-Interleukin-18 antibody light chain variable region (VL). It can be used in the production of recombinant monoclonal antibody #125-2HmAb, which is capable of neutralising biological activities of interleukin-18. The antibody has antiinflammatory, immunosuppressive, leucocytopoletic, antiallypretic, antiallergic and hepatotroppic activity and can be used for prevention and treatment of autoimmune diseases, immunopathies and inflammatory disorders caused by excessive immunoreaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S-surface antigen; Hepatitis B virus; HBV; therapy; infection; virucide;

The variable regions of the antibodies are useful against HBV S-surface antigens, e.g. adr, adw, ayr or ayw, particularly for neutralising or removing HBV. They may also be employed to treat or prevent HBV infection. The present sequence is Escherichia coll light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New light and heavy chain variable regions of a monoclonal antibody against the S-surface antigen of the hepatitis B virus (HBV), useful for neutralizing or removing HBV, or for preventing or treating HBV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           390

The present sequence encodes the murine anti-idiotype monoclonal antibody (MAb) 1A7 variable light chain. MAb 1A7 was raised against the antiposide 2 (GD2) MAb 14G2a, which binds an unique epitope of GD2. As the glycosphingolipid GD2 is expressed at high density by human neuroectodermal tumours, e.g. malignant melanoma. Concertoblastoma, glioma, soft tissue sarcoma and small cell carcinoma of the lung, MAb 1A7, or its CDN can be used in a vaccine to treat or palliate such diseases. They can also be used to reduce the anti-GD2 Ab bound to a tumour cell.

MAD 1A7 overcomes immune tolerance and induces an immune response against GD2, which comprises anti-GD2 Ab (humoral response) and CD2-specific cells (cellular response). It can be used to purify anti-GD2, which comprises the level of cellular anti-1A7 or anti-GD2 in a sample or measure the level of cellular anti-1A7 or anti-GD2 activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes mouse light chain variable region. This recombinant DNA is derived from PCR A which amplifies antibody light chain variable region (VL). The transforment produced using the VL gene was used transform competent E. colis. The peptide produced by transformants neutralises interleukin-18. This is useful for treating and preventing immunopathies, inflammatory disorders and autoimmune diseases which are caused by excessive immunoreaction. The peptide has anti-allergic, anti-inflammatory, immunosuppressive, hematopoietic, leukocytopoletic, anti-life antipyretic and hepatic-function improving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New artificially produced peptide for neutralizing biological activity of interleukin-18, useful for treating and preventing immunopathies, inflammatory disorders and autoimmune diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anti-idiotype monoclonal antibody 1A7 variable light chain, cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Murine; mouse; anti-idiotype; monoclonal antibody; MAb; 1A7;

The invention provides a monoclonal antibody (MAD) designated 1A7, which elicits an anti-GD2 (tumor-associated antigen) immunological response in humans. MAD 1A7 has defined light and heavy chain variable region sequences. The MAD 1A7 and polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can also be used for detecting or purifying anti-GD2 antibody. The products can be used for treating GD2 associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. The present sequence represents the CDNA encoding the light chain variable region of MAD 1A7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Monoclonal antibody 1A7 which elicits an anti-GD2 immunological response, useful for the development of products for the detection and treatment of cancers -

Richard Hodes, Emily Klotz (National Institute on Aging and National Center B Cells were provided by Brs. Richard Hodes, Emily Klotz (National Institute on Aging and National Center B Cells (Nas) and Garnett Kelsoe (Duke University, USA). Double-stranded cDNAs were synthesized from 0.46 ug of total RNA with an Oligo(dT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           primer Invitrogen:
5'-pactractions and purified by
treated with T4 DNA polymerase, and purified by
ethanol-precipitation. The cDNAs were ligated to
lone-linker LL-Sal3 (Ref. Development 127: 1737-1749 (2000
) [PMID: 1072549]), purified by phenol/chloroform, and
separated from free linkers by Centricon 100. Then, cDNAs
were amplified by long-range high fidelity PCR using Ex
Tag polymerase (Takara) and purified by phenol/chloroform,
followed by Centricon 100 purification. The cDNAs
were diffication 100 purification. The cDNAs were

ID10 was obtained by immunishing malve mice with MC-10 anti-HMFG antibody to obtain an anti-idiotype response. It elicits an immune response against a specific epitope of a high mol.wt. mucin of human mill fat globule (HMFG). It induces an immunological response to HMFG in mice, rabbits, monkeys and patients with advanced HMFG-associated tumours. Pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         compositions and vaccines comprising 11D10, 11D10 polypeptides and/or 11D10 polypeptides and/or 11D10 polypeptides and/or 11D10 polynucleotides (see also AAT85149-50) are claimed. Also claimed are diagnostic kits and methods of using 11D10, 11D10 polypeptides and/or 11D10 polynucleotides, including methods of treating HMRG-associated tumours. 11D10 is also used in a claimed method of palliating HMRG-associated disease and in claimed kits to

The invention comprises a method for delaying the development of, or treating a timmour that is associated with human milk fat globules (HMFG) or carcinoembryonic antigen (CEA). The method of the invention involves endministering an anti-idiotypic antibody for HMFG (e.g. 11D10), and an anti-idiotypic antibody for CEA (e.g. 3H1). The method is useful for anti-idiotypic antibody for CEA (e.g. 3H1). The method is useful for present antino acid sequence represents the light chain variable region of the mouse 11D10 anti-idiotype antibody.

This anti-idiotype antibody is used to delay the development of, or treat, a human milk fat globule (HMFG) associated tumour in an individual having low tumour burden. The antibody 11D10 is used to prevent the recurrence of HMFG-associated tumours e.g. ovarian, non-small cell lung and pancreatic carcinoma, especially for

This was encoded by a recombinant DNA is derived from PCR A which amplifies antibody light chain variable region (VL). The transformant produced using the VL gene was used transform competent E. coli cells. The peptide produced by transformants neutralises interleukin-18. This is useful for treating and preventing immunopathies, inflammatory disorders and autoimmune diseases which are caused by excessive immunoraction. The peptide has anti-allergic, anti-inflammatory, immunosuppressive, hematopoletic, leukocytopoletic, antialgic, antipyretic and hepatic
                                                                                                                                                                                                                                                                       Mouse light chain variable region; VL; variable region light chain; interleukin-18; immunopathise; inflammatory disorder; autoimmune disease; mouse; anti-allergic; anti-inflammatory; immunosuppressive; hematopoletic; leukocytopoietic; antialgic; antipyretic.

The conjugate is capable of delivering the antigen to APC and eliciting an immune response to the antigen. The new conjugates are useful as vaccines and are able to elicit an enhanced immune response without the use of an adjuvant. In a specific example, a conjugate was constructed using the murine anti-human class II monoclonal antibody secreted by hybridoma at andemly linked T and B cell epitope derived from HIV MN strain. The present sequence represents the light chain variable region from 44H104 which was used in the preparation of a conjugate with

             The invention relates to a recombinant conjugate antibody, comprising a monoclonal antibody specific for a surface structure of antigen presenting cells genetically modified to contain an antigen moiety for the purpose of delivery of the antigen moiety to antigen. Presenting cells of the immune system. The conjugate antibody is formulated as a vaccine to protect a host against a disease caused by a pathogen expressing the antigen. The antibody is useful as a detecting agent. The present sequence is murine 44H104 mab variable light chain (VL), alternative version.

Note: This sequence SEO.ID.NO:2 is stated to be similar to the sequence shown in fig 1A (AAE20200). However these sequences differ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MGAPAQILGFLLLLFPGTRCDIQMTQSPSSLSASLGQRVSLTCRASQDIGINLHWLQQEP

Presenting cells of the immune system. The conjugate antibody is formulated as a vaccine to protect a host against a disease caused by a pathogen expressing the antigen. The antibody is useful as a detecting agent. The present sequence is murine 44H104 mab variable light chain (VL).

Note: This sequence SEQ.ID.NO:2 is stated to be similar to the sequence shown in page 11-12 of the specification (AAE20204).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 c-erbB-2 refers to a protein antigen expressed on the surface of tumour cells. such as breast and ovarian tumour cells, which is an approx. 200,000 mol. wt. acidic glycoprotein having an isolelectric pt. of about 5.3 (see AQ40603, AR839560). A single chain Fv (sFv) is a covalently linked VH-VL heterodimer which is expressed from a gene fusion including VH- and VL- encoding genes connected by a peptide-encoding linker. Such linker sequences are set forth in AA residues 116-135 in AAR39569, which includes part of the 16 AA linker sequences in AAR39572. Using AAQ46084 for the 520C9 monoclonal antibody, a single chain polypeptide can be produced having a binding affinity for a c-erbB-2 related antigen. 'X' in AAR39569 refers to the location of a stop codon in AAQ46084.
                                                                                                                                                                                                                                                                                                     Single chain Fv polypeptide; VH-VL heterodimer; immunoglobulin; Ig; blosynthetic single polypeptide chain binding site; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

A two single chain FV (SFV) gene was constructed by connecting the VH and VL genes with a Ser rich polypeptide linker. The resulting 520C9 two SFV gene, which encodes the present sequence, was inserted into an expression to vector, transformed into E. coll, and protein expression induced by the addn. Of IPPG to the culture medium.

A compsn. comprising a carrier and the 2 sFV protein prod. can be used for in vivo imaging, and drug targetting experiments. The case for in vivo imaging, and drug targetting experiments. The case and interest of the same antigen, therefore glving greater binding avoidity and chonger tissue retention times, compared to individual sFV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
Compsns. contg. antigen-targetting antibody fragment constructs comprising dimer of single-chain Fv fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                      520C9; anti-c-erbB-2 monoclonal antibody; single chain Fv; sFv construct; polypeptide linker; C-terminal amino acid sequence; in vivo imaging; drug targetting experiment; homodimer; increased; binding avidity; tissue retention time.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This represents the protein sequence of a 520C9 sFV' (single chain FV) construct. This was constructed by connecting the Vh and VI genes with a DNA sequence encoding a Serine rich linker. 520C9 is a monoclonal antibody useful in targeting c-erbB-2 antigen. This dimeric construct can be used in the methods of invention of imaging a preselected antigen expressed in a mammal. The methods are used in magnetic resonance imaging of c-erbB-2 or related antigens in cancer diagnosis. The biosynthetic constructs have enhanced properties as in vivo targetting agents in comparison with intact monoclonal antibodies or their Fab fragments. The dimeric constructs permit the in vivo targetting of an epitope on an antigen with greater apparent avidity, including greater tumour specificity, tumour localisation and tumour retention properties than that of the Fab fragment having the same CDRS as the construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  21 DIOMTQSPSSLSASLGQRVSLTCRASQDIGINLHWLQQEPDGTIKRLIYATSSLGSGVPK 80

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents an antibody 520C9 sFV. Variable heavy and light sequences of antibody 7520C9 are connected, together with a serine linker, to produce the present single chain FV gene. The present sequence exemplifies the invention. Dimers of the single chain FV are used for targeted delivery of drugs or imaging agents (e.g. cytotoxins, producus or 99m-technetium) to antigen-expressing cells, particularly for treatment or diagnosis of tumours (especially of ovary or breast).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21 DIQMTQSPSSLSASLGQRVSLTCRASQDIGINLHWLQQEPDGTIKRLIYATSSLGSGVPK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present protein sequence is the mouse anti-Interleukin-18 antibody light chain variable region (VL) encoded by cDNA derived from hybridoma 1815-2H. The nucleotide sequence is used in the production of recombinant monoclonal antibody #125-2HmAb, which is capable of neutralising biological activities of interleukin-18. The antibody has antialic, antilinfammatory, Immunosuppressive, leucocytopoietic, antipyretic, antialized and hepatotropic activity and can be used for prevention and treatment of autoimmune diseases, immunopathies and inflammatory diseases, immunoreaction.
                Anti-Interleukin-18 antibody; IL-18; light chain variable region; VL; bybridoma #125-21mAb; mouse; monoclonal antibody #125-21mAb; interleukin-18; antiinflammatory; immunosuppressive; leucocytopoietic; antialgic; antipaticropic; treatment; autoimmune disease; immunopathy; inflammatory disorder; immunoreaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  autoimmune disease; head; neck; stomach; oesophagus; colon; liver; ovary; intraheptic bile duct; pancreas; lung; larynx; breast; uterus; cervix; prostate; kidney; testis; thyroid; bladder; brain; melanoma; myeloma; Fv; sarcoma; leukaemia; lymphoma; virus; bacterium; fungus; protozoan; DaPlO; helminth; cytostatic; antimicrobial; immunomodulatory; 1182D10; 6H7E7;

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated pulsulated to the treatment of cancer, infections and/or autoimmune composition for the treatment of cancer, infections and/or autoimmune compositions. The cancer may be a tumour of the head and neck, stomach, oesophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, the infectious diseases can be caused by viruses, bacteria, fungi, protozoa or helminths. The autoimmune diseases include multiple clerosis, Grave's disease, ankylosing spondylitis, acute anterior uveitis, Goodpasture's syndrome, myasthenia gravis, insulin-dependent diabetes mellitus, rheumatoid arthritis, pemphigus vulgaris and autoimmune hepatisis. Sequences AMJ72875 represent the NKG2D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        130 GGGSELVMTQSPSSLSASLGERVSLTCRASQDIGSSLNWLQQEPDGTIKRLIYATSSLDS 189

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NG3D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated polynucleotide are used for the preparation of a pharmaceutical composition for the treatment of cancer, infections and/or autoimmune composition for the treatment of cancer, infections and/or autoimmune confitions. The cancer may be a tumour of the head and neck, stomach, oesophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, larynx, breast, ovary, uterus, cervix, prostate, backenia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, protozoa or helminths. The autoimmune diseases include multiple cuefits, Goodpasture's syndrome, myasthenia gravis, insulin-dependent diabetes mellitus, rheumatoid arthritis, pemphigus vulgaris and autoimmune hepatitis. Sequences AAU72820-AAU72875 represent the NKG2D receptor and the polypeptides of the invention.
